Tokenized Checkout Process

Description of bKash's Tokenized Checkout process and relevant APIs

bKash's tokenized checkout provides the customers a more convenient way of payment. Using this product, the customers can create an agreement in merchant websites/apps that for further payment using bKash, they will only use bkash wallet PIN. In this case the merchant system needs to store these agreements against different user accounts. This provides a faster and convenient payment opportunity for both the merchant and the customer.

Steps to be Performed by the Customer

The customer needs to be logged in to the merchant website or mobile app.

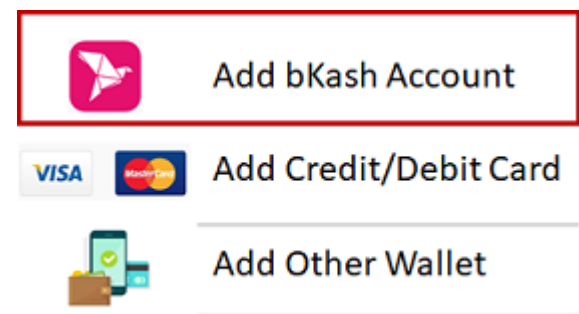

- Customer clicks on "Add bKash Account" or similar button in the merchant website or mobile app.
- A bKash page is loaded where the customer needs to enter his bKash wallet number and also agree to the terms and condition. If the wallet number is valid, then the customer moves to the next page.
- A 6 digit OTP is sent to customer's registered mobile number at bKash account through SMS. Customer needs to enter the OTP in the next page. If the OTP validation is successful, then the agreement creation is completed.

During payment, the customer needs to visit the merchant website or mobile app and needs to login.

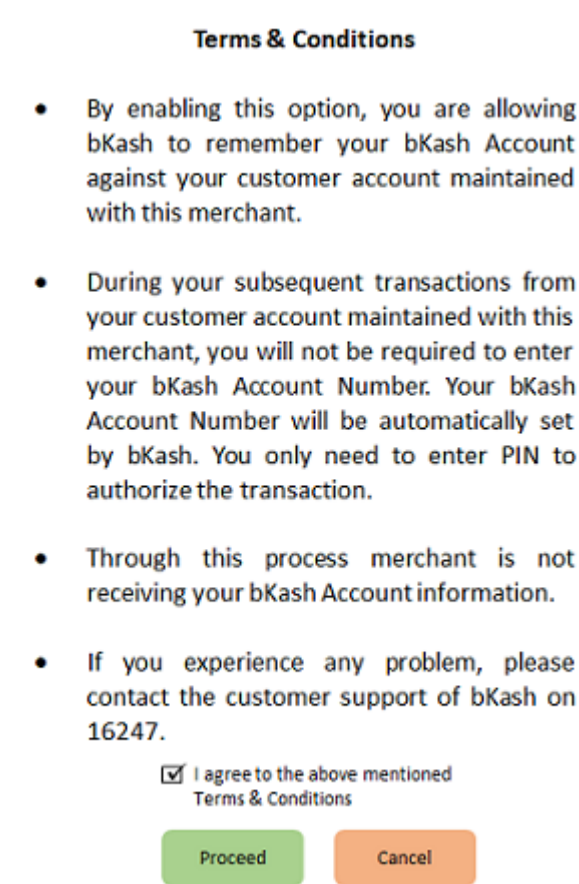

- Customer needs to click on "Pay with bKash" or similar button.
- Then customer will see a list of his added bKash accounts. From there he needs to select his desired account.
- Then customer will see a screen where he needs to enter his bKash wallet number. In the same page he will need to enter his bKash wallet PIN. After successful PIN verification, the payment will be completed.
- The customer will see payment completion notification and will be reverted back to the merchant website or app.

Customer Interaction Flow

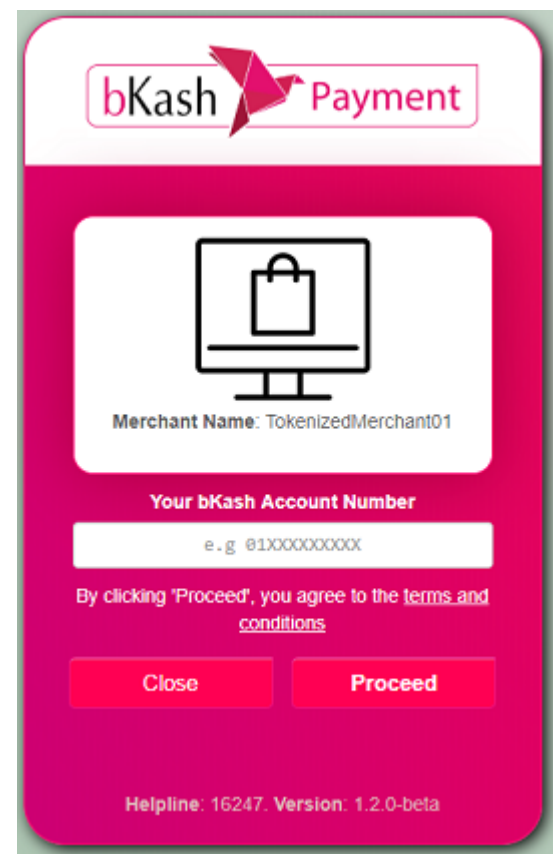

Customer will have to be logged in to the merchant website/app. For creating agreement, select "Add bKash Account" or similar button (at merchant website/app).

Agree to the Terms & Conditions (at merchant website/app).

Enter wallet number (at bKash page).

Enter OTP (at bKash page).

Customer Interaction Flow

System Interaction

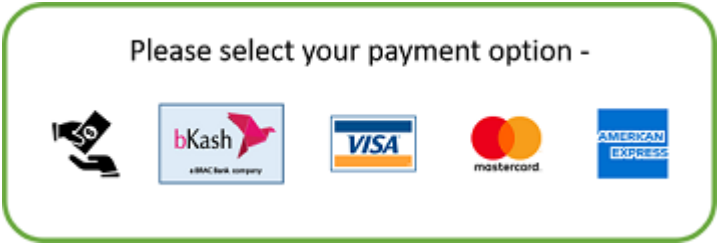

System Interaction Flow

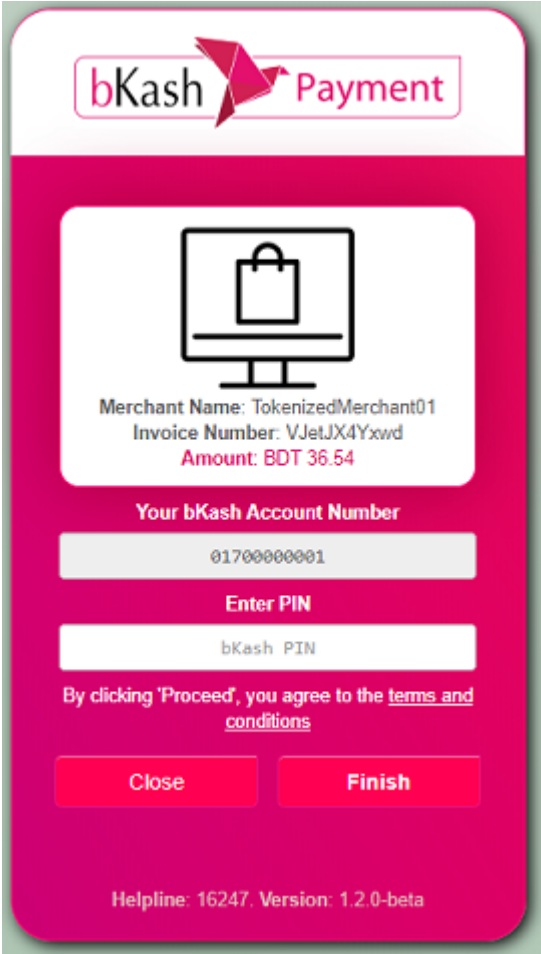

Customer will see successful message for adding bKash account.

Your bKash account has been added successfully

For payment, customer will have to be logged in to merchant's website/app. During payment, select bKash as payment method (at merchant website/app).

Enter bKash wallet PIN (at bKash page).

After successful verification at bKash end, customer will see corresponding message at merchant website/app.

Your payment has been successful

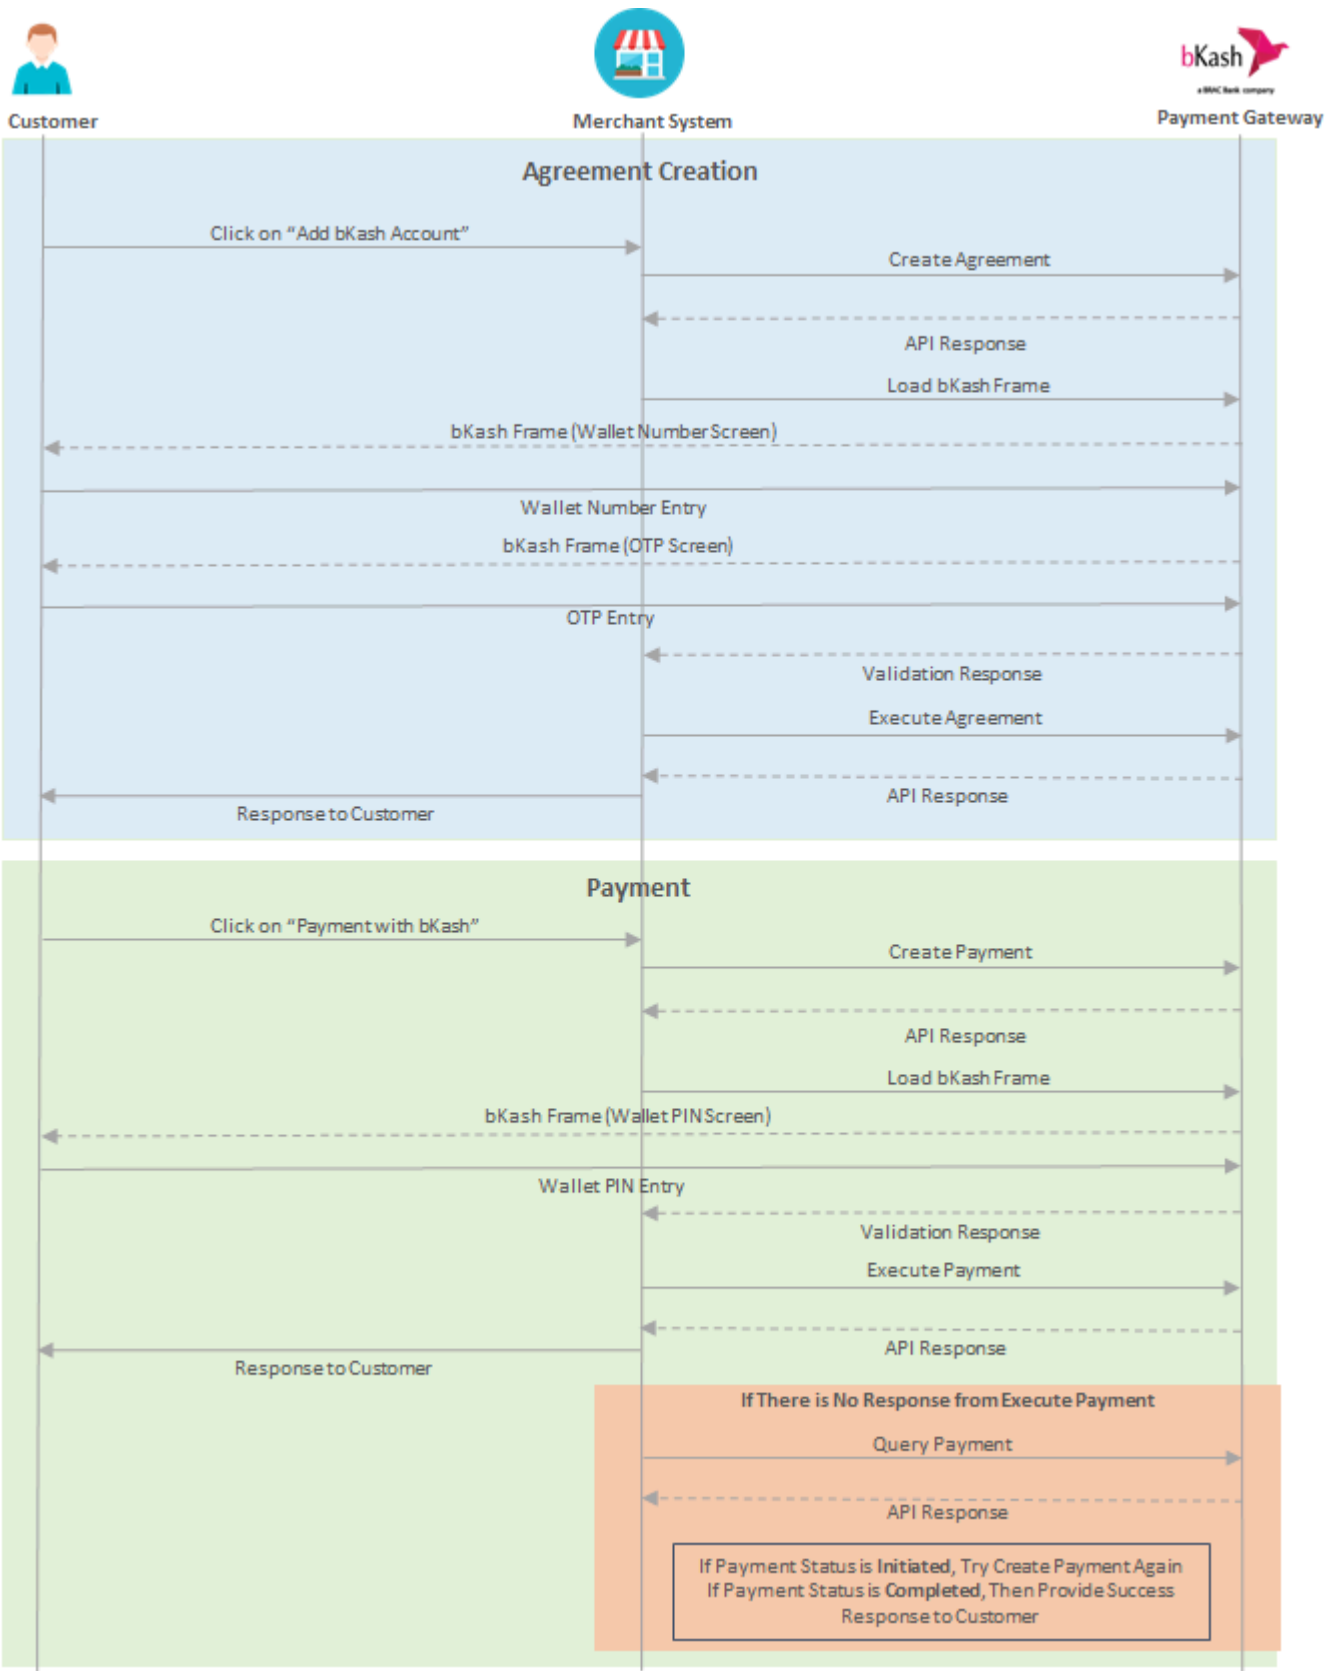

System Interaction

Before calling any bKash API, please make sure you have valid authorization tokens. To know more about tokens, visit the [Token Management page](#).

Following steps will take place at system level along with corresponding customer action -

- When customer clicks "Add bKash Account" or similar button, call the [Create Agreement API](#) with the value "0000" for "mode" parameter.
- If success response comes, load the "bKashURL" which was passed in the response of Create Agreement API. Here the customer will enter his bKash wallet information for creating agreement.
- In the bKash page, customer will enter his wallet number and 6-digit OTP one by one.
- After succesful validation of all these customer information, bKash will respond to the "successCallbackURL" which was passed in the Create Agreement API response. For failed and canceled transactions, bKash will respond to the "failureCallbackURL" and "cancelledCallbackURL" respectively, which were also passed in the Create Agreement API response.
- For successful response, [Execute Agreement API](#) needs to be called.
- At successful response of the Execute Agreement API, the agreement creation will be completed.
- When customer clicks "Payment with bKash" or similar button, call the [Create Payment API](#) with the value "0001" for "mode" parameter.
- If success response comes, load the "bKashURL" which was passed in the response of Create Payment API. Here the customer will enter his bKash wallet information for proceeding to payment.
- In the bKash page, customer will enter his wallet PIN.
- After succesful validation of all these customer information, bKash will respond to the "successCallbackURL" which was passed in the Create Payment API response. For failed and canceled transactions, bKash will respond to the "failureCallbackURL" and "cancelledCallbackURL" respectively, which were also passed in the Create Payment API response.
- For successful response, [Execute Payment API](#) needs to be called.
- At successful response of the Execute Payment API, the payment will be completed.
- If there is no response from Execute Payment API, call [Query Payment API](#) to know the status of the pending payment. If the status is "Initiated", try from Create Payment again. If the status is "Completed", then provide success response to the customer.
- Implement default timeout value of bKash APIs as 30 seconds.
